

Project Vision

- We want to create an **interactive, game-based experience** to educate students in a more engaging and memorable way.
 - The goal is to move beyond passive learning and instead use gameplay to teach sustainability concepts.
 - The game should feel fun first, but still clearly communicate an educational message.
-

Target Audience

- Primary focus: **University of St. Thomas students**, especially incoming and first-year students.
 - The game could be introduced during welcome events, Earth Week, or other campus activities.
-

Implementation Ideas

- Host the game in a **booth at a campus event** to encourage participation and visibility.
 - Long-term, a **website-based version** seems like the best platform for accessibility and scalability.
 - The website should be:
 - Easy to access (QR code friendly)
 - Simple to maintain
 - Usable even when our team is not physically present
-

Game Concept Direction

- The project should be **more game-based than a personal sustainability tracker**.
 - Possible idea: a **trash-sorting game**.
 - Use real-life St. Thomas trash cans (recycling, compost, landfill).
 - Include actual products commonly used around campus (coffee cups, dining hall containers, snack wrappers, etc.).
 - Provide instant feedback so players learn from mistakes.
-

Collaboration & Logistics

- Reach out to the **Director** about the possibility of hosting the game at an official event.
 - Contact **St. Thomas ITS** to ask about server access or hosting support if needed.
 - Follow up regarding the **project budget** to understand available resources.
-

Communication & Meetings

- Preferred communication methods: **Email or Microsoft Teams**.
- Plan to meet **every two weeks**, with additional meetings scheduled if needed to stay on track.
